

GENERAL DESCRIPTION

This document describes specifications for the F1653NLGI I/Q Modulator implementing Zero-Distortion™ technology for low power consumption with improved ACLR. This device interfaces directly to a high performance dual DAC.

COMPETITIVE ADVANTAGE

In typical multi-mode, multi-carrier basestation transmitters the modulator has limited linearity and high power consumption which penalizes the system ACLR and system Power consumptions budgets in a Digital-Pre-Distortion environment.

The IDTF1653 is designed to eliminate these penalties by embedding Zero-Distortion™ technology into the device such that very high IP3 and IP2 are achieved with minimal current draw.

- Power consumption ↓**45%**
- IM3 Distortion ↓**14 dB**

PART# MATRIX

Part#	RF freq Range	IP2 _o	Power Cons.	IP3 _o	Noise
F1650	600 – 2400	+60 dBm	587 mW	+36 dBm	-158 dBm/Hz
F1653	600 – 2900	+64 dBm	587 mW	+36 dBm	-159 dBm/Hz

FEATURES

- Power Gain = 3dB
- Direct 100Ω differential drive from Tx DAC
- **< 590mW Power Consumption**
- -159 dBm/Hz Output Noise
- -161 dBc/Hz Internal LO Path Noise
- IP2_o = +64 dBm @ 2GHz
- **IP3_o = +36 dBm @ 2GHz**
- Excellent native LO and image suppression
- 600 MHz input 1dB Bandwidth
- 600 MHz to 2900 MHz RF BW
- **Fast Settling for TDD (< 200 nsec)**
- 3.3V Single Power Supply
- LO port can be driven single ended or differential
- 4mm x 4mm, 24-pin TQFN package

DEVICE BLOCK DIAGRAM

ORDERING INFORMATION

ABSOLUTE MAXIMUM RATINGS

VDD to GND	-0.3V to +3.6V
STBY	-0.3V to (VDD + 0.3V)
BB_I+, BB_I-, BB_Q+, BB_Q-	-0.3V to 1.8V
LO_IN	-0.3V to 0.3V
RF_OUT	(VDD-0.35V) to (VDD-0.05V)
Continuous Power Dissipation	1.5W
θ_{JA} (Junction – Ambient)	+45°C/W
θ_{JC} (Junction – Case) The Case is defined as the exposed paddle	+2.5°C/W
Operating Temperature Range (Case Temperature)	$T_{CASE} = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+260°C

Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

IDTF1653 RECOMMENDED OPERATION CONDITIONS

Parameter	Symbol	Comment	min	typ	max	units
Supply Voltage(s)	V_{DD}	All V_{DD} pins	3.15	3.30	3.45	V
Operating Temperature	T_{CASE}	Case Temperature	-40	25	+105	deg C
LO Freq Range	F_{LO}	LO power -3dBm to +5dBm	600		2900	MHz
BB Common Mode Voltage	V_{CM}	<ul style="list-style-type: none">• $T_{CASE} = -40C$ to $+105C$• $V_{DD} = 3.3$ V• LO level = 0dBm	0.1	0.25	0.8	V
BB input voltage compliance range		For each BB pin	0		1	Vpeak
BB Freq Range	F_{BB}	<ul style="list-style-type: none">▪ $F_{LO} = 1950$ MHz, $BB_IQ = 200$ mVp-p▪ P_{RF} degrades < 1 dB	DC		600	MHz

IDTF1653 SPECIFICATION

See application circuit. Typical values are measured at $V_{DD} = +3.3V$, $F_{LO} = 1950$ MHz, $P_{LO} = 0$ dBm, $T_{CASE} = +25^{\circ}C$, STBY = GND, BB_IQ frequency = 49, 50 MHz, BB_I&Q levels = 200 mVp-p each (-13dBm and 14 dB backoff from 1V DAC compliance), I & Q = 0.250V common-mode bias unless otherwise noted.

Parameter	Symbol	Comment	min	typ	max	units
Logic Input High	V_{IH}	For STBY Pin	1.07			V
Logic Input Low	V_{IL}	For STBY Pin			0.68	V
Logic Current	I_{IH}, I_{IL}	For STBY Pin	-100		+1	μA
Supply Current (ON)	I_{SUPP}	Total V_{DD}		178	190¹	mA
Supply Current (STBY)	I_{STBY}	Total V_{DD} , STBY = V_{IH}		2.8	5	mA
LO Power	P_{LO}	600MHz to 2900MHz	-3		+5	dBm
BB Input Resistance (Differential)	R_{BB}	Freq = 100 MHz		113		Ω
LO port Impedance	Z_{LO}	<ul style="list-style-type: none"> Single Ended (RL < -10dB) Can be driven differentially 		50		Ω
RF port Impedance	Z_{RF}	Single Ended (RL < -10dB)		50		Ω
Power Gain	G		2.0	3.0	4.0	dB
Output IP3 @ 850 MHz	$IP3_{O1}$	LO = 800 MHz		37		dBm
Output IP3 @ 2.00 GHz	$IP3_{O2}$	LO = 1950 MHz	30	36		
Output IP3 @ 2.85 GHz	$IP3_{O3}$	LO = 2800 MHz		31		
Output IP2 @ 850 MHz	$IP2_{O1}$	LO = 800 MHz Differential baseband input		65		dBm
Output IP2 @ 2.00 GHz	$IP2_{O}$	LO = 1950 MHz Differential baseband input	58^2	64		
Output IP2 @ 2.85 GHz	$IP3_{O2}$	LO = 2800 MHz Differential baseband input		63		
Turn on time	P_{ON}	STBY = low to 90% final output power		175		nsec
Turn off time	P_{OFF}	STBY = high to initial output power -30dB		26		
LO (Carrier) Suppression	LO_{supp}	Native, Uncorrected $F_{LO} = 1950$ MHz		-39	-30	dBm
Sideband (Image) Suppression	SS	Native, Uncorrected $F_{LO} = 1950$ MHz Differential baseband input		-34	-30	dBc
Output P1dB	$P1dB_O$	Output Compression		15		dBm
Output Noise	NSD	<ul style="list-style-type: none"> 10 MHz offset from LO BB I&Q levels = 0 V_{p,p} 	-157	-159		dBm/Hz
LO Path Noise (internal)	$\Phi_{N,LO}$	+10 MHz offset		-161		dBc/Hz

SPECIFICATION NOTES:

- 1 – Items in min/max columns in **bold italics** are Guaranteed by Test
- 2 – All other Items in min/max columns are Guaranteed by Design Characterization

TYPICAL OPERATING CONDITIONS GRAPHS

Unless otherwise noted, the following conditions apply:

- Baseband I&Q levels = 200 mV_{PP} each (-13 dBm / Channel / Tone)
- Baseband I&Q tones = 49, 50 MHz
- Low Side Injection
- T_{AMB} = 25C, V_{CC} = 3.30 V, LO Power = 0 dBm
- V_{CM} = 0.250 Volts
- Flo = 1.95GHz unless otherwise specified
- EVKit RF output Trace and Connector Losses De-Embedded

Carrier Suppression Nulling Performance

Image Suppression Nulling Performance

GENERIC DAC INTERFACE

- LCM DAC: low common mode voltage DAC usually has high output impedance and sourcing current out
- LPF: to filter out unwanted harmonics
- DC common mode voltage on BBP/BBN V_{cm} : $V_{cm} = I_{DC} \times R_{dac} // R_{dc_IQMOD}$
- V_{cm} is determined by DAC bias current and IQ Mod input DC impedance

PIN DIAGRAM

TOP View

(looking through the top of the package)

PIN DESCRIPTIONS

Pins	Name	Function
1	STBY	STBY Mode. Pull this pin high for Standby Mode. Pull low or ground for Normal Operation.
2, 5, 13, 19	GND	Ground these pins.
6, 7, 8, 11, 12, 14, 15, 17, 20, 23	NC	IDT recommends grounding these pins.
3, 4	LO+, LO-	Local oscillator (LO) 50 ohm differential or 25ohm each pin single-ended input. Pins must be ac-coupled. For 50 ohm single-ended operation, ac-couple USED Pin to 50 ohm termination and ac-couple UNUSED pin to GND.
9, 10	BB_Q-, BB_Q+	<i>Quadrature</i> differential baseband input. Internally matched to 100 ohms.
16	RF_OUT	RF output. Must be ac-coupled.
18, 24	VDD	Power Supply. Bypass to GND with capacitors as shown in the Typical Application Circuit as close to pin as possible.
21, 22	BB_I+, BB_I-	<i>In-Phase</i> differential baseband input. Internally matched to 100 ohms.
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the specified RF performance.

EVKIT SCHEMATIC

POWER SUPPLIES

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V/20\mu s$. In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

APPLYING V_{CM} AT THE BASEBAND INPUTS

With L1, L2, L3, and L4 unpopulated, the common mode voltage is set by VR2 and VR4. The voltage set by VR2 has a DC path through the balun transformer T1 to pins BB_{I+} and BB_{I-}, as highlighted. This also applies for VR4, T2, and pins BB_{Q+} and BB_{Q-}. With this configuration, the same voltage will be applied to BB_{I+} and BB_{I-} and the same voltage will be applied to BB_{Q+} and BB_{Q-}. The I and Q common mode voltages may be different from each other to null LO (carrier) leakage.

EVKIT PICTURE:

Note: VCC connection on evaluation board is VDD Power Supply on the datasheet.

VDD connection on evaluation board is used to set baseband pin common mode (CM) voltage (see schematic)
